Introducing Today's Project!

What is Amazon Lex?

How I used Amazon Lex in this project

One thing I didn't expect in this project was...

This project took me...

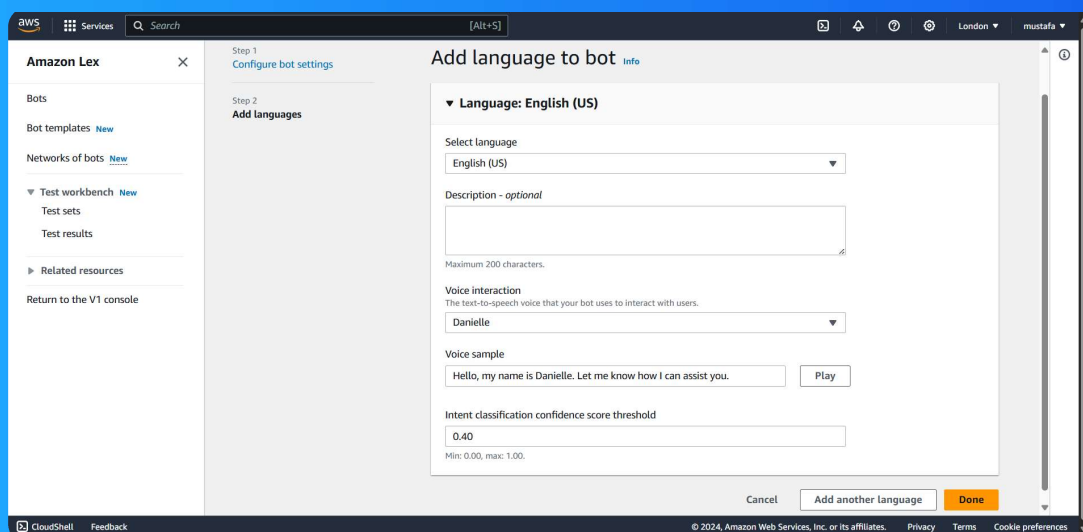

Setting up a Lex chatbot

I created my chatbot from scratch with Amazon Lex. Setting it up took me 5 minutes

While creating my chatbot, I also created a role with basic permissions because Amazon lex needs the permission to call other AWS services on your behalf. An example of a service being AWS Lambda.

In terms of the intent classification confidence score, I kept the default value of 0.40. This means that your chatbot needs to be at least 40% confident that it understands what the user is asking to be able to give a response.

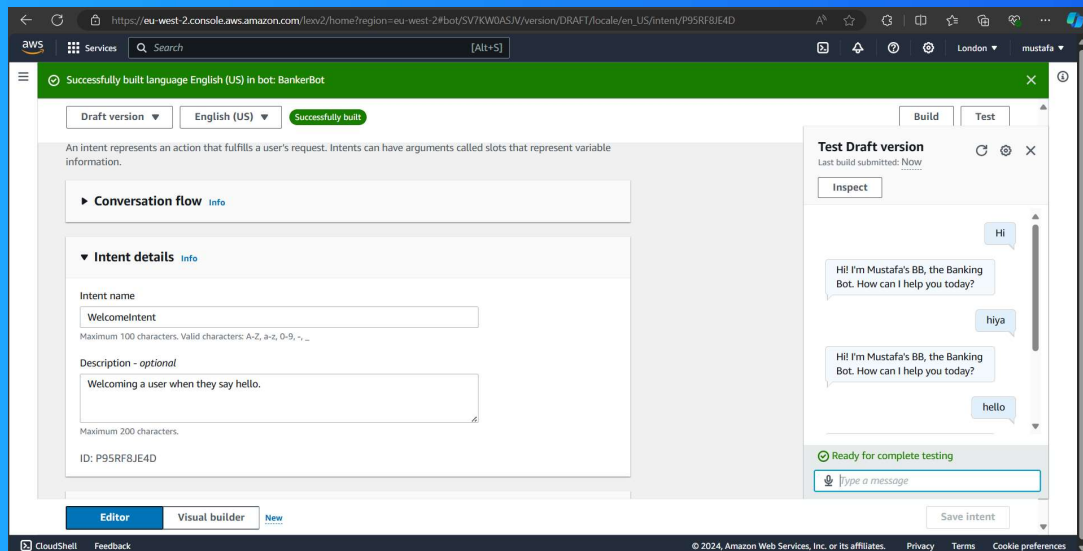

Intents

Intents are what the user is trying to achieve in their conversation with the chatbot. For example, checking a bank account balance; booking a flight; ordering food.

I created my first intent, WelcomeIntent, to welcome users to the chatbot.

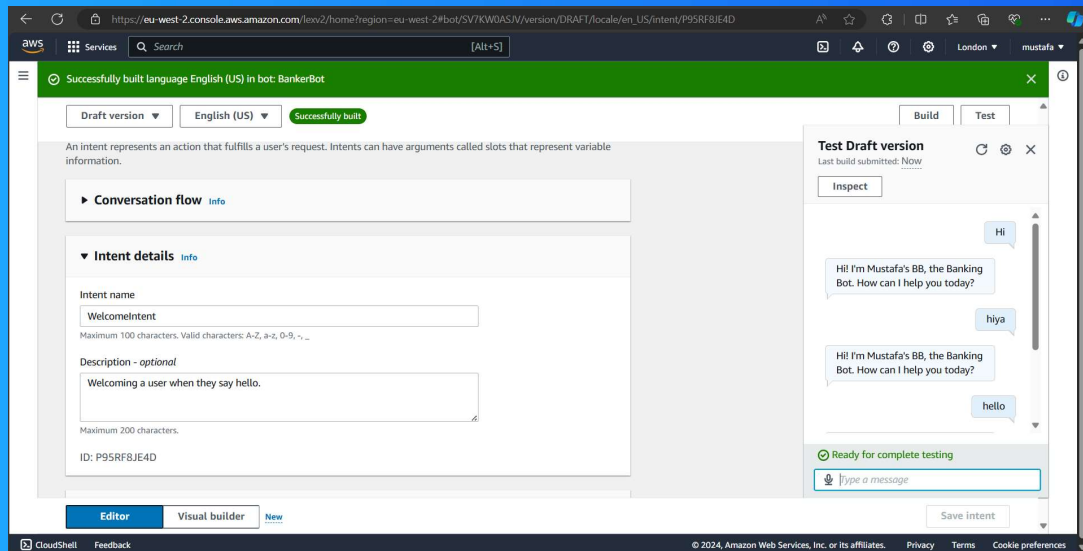

FallbackIntent

I launched and tested my chatbot, which could respond successfully if I enter phrases within the sample utterance such as "Hi", "Hello" and "I need your help".

My chatbot returned the error message `Intent FallbackIntent is fulfilled` when I entered... This error message occurred because Amazon Lex doesn't quite recognize the entered utterance.

Configuring FallbackIntent

FallbackIntent is a default intent in every chatbot that gets triggered when chatbot doesn't understand the user's request and returns a result lower than the intent classification confidence score threshold.

I wanted to configure FallbackIntent because it's clearer to the user that your chatbot doesn't understand the user's request.

Variations

Everyone should be in a job they love.
